4. Burndown Chart

5. Reflection Questions

1. Did your estimations reflect the actual effort?

Not really, the estimates didn't get tested against real day-by-day effort. As it was a simulated sprint rather than actual development work, the estimates didn't get validated against real implementation time.

2. Was your backlog well-prioritized?

Yes. Core functional stories tied to campaign creation, pledging, and milestone verification were marked High priority since they represent the platform's critical path, while supporting features like referral discounts were kept Low priority.

3. How did your simulated sprint align with your plan?

The lab's intent was to simulate realistic progress by moving the tasks, from To Do to In Progress to Done in one stretch for all 5 stories. So, the simulation didn't capture the gradual movement a real sprint would show.

4. What insights did the burndown chart give about your team’s capacity?

The chart suggests that the team finished far ahead of schedule relative to the guideline. This can suggest that the team underestimated their capacity and could have taken on more stories, or the stories themselves weren't broken down finely enough to show meaningful incremental progress.
